

# Code Quality Metrics

Why Evolution is needed for Software Metrics

## Product Quality Methods

### ■ Software Assessment/Certification

- Manual and laborious process
- Good results

### ■ Automatic Software Monitoring

- Automated process
- Partial results

## TIOBE Software Mission

TIOBE software is a service company that supports its customers with obtaining and monitoring software quality data

This is achieved by applying its TICS framework and in-depth knowledge of static analysis technologies

## Why are Software Metrics not used?

- Other paradigms were dominant so far
  - Process quality metrics: SEI's CMM(I)
  - Metrics on demand: GQM
- Essential characteristics missing
  - Clear definition
  - Normative values
  - Reality check

TIOBE SOFTWARE - The Coding Standards Company

## Example: Cyclomatic Complexity

- What does "cyclomatic" mean?
- Definition:  $CC = E - N + 2P$ 
  - E = Number of edges of the graph
  - N = Number of nodes of the graph
  - P = Number of connected components
- What is the scope? Program? Class? Function?
- What is the norm? McCabe: 10 is too much
- CC of "if" and "while" statement is equal

## But there is also good News!

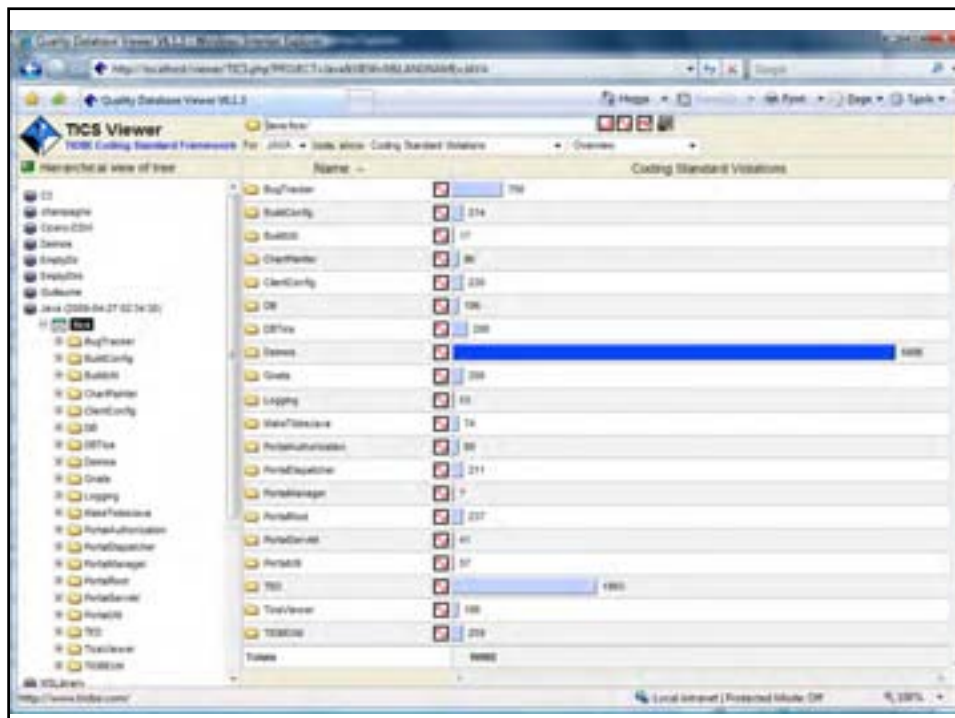

### ■ Static confidence factor (TIOBE)

- Metric defined by evolution (2003 - 2009)
- Measuring the static quality of a program

### ■ Starting Point: coding standard violations

- Layout issues: right indentation
- Naming conventions: methods lowercase
- Programming errors: compare floats

# Coding Standard Violations improved

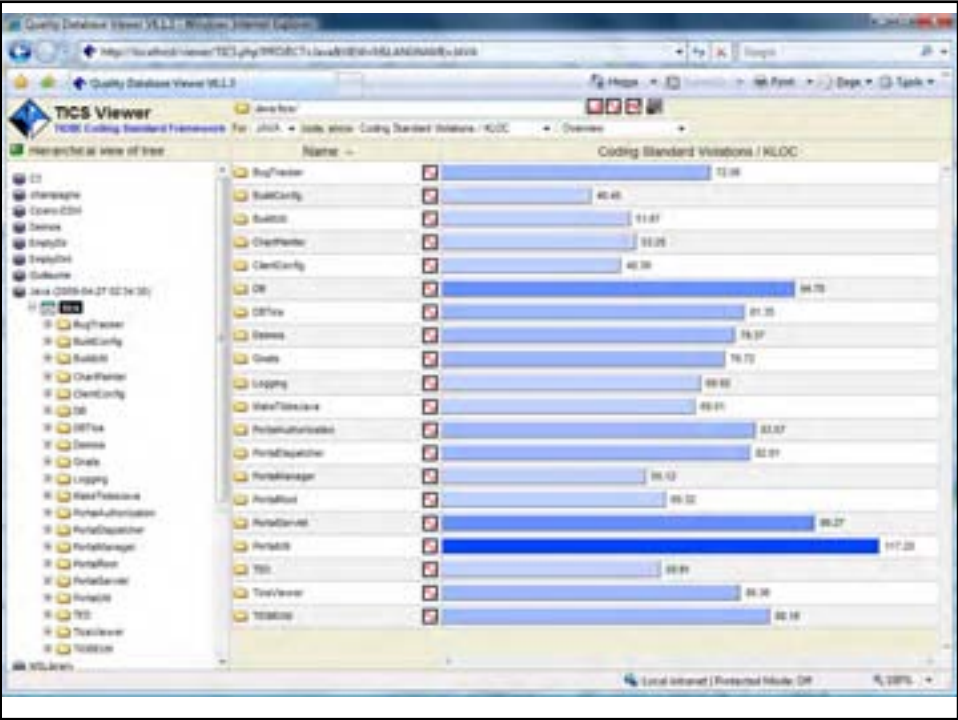

- Number of violations don't say much:
  - What does 5,886 violations mean?
  - Should we fire everybody?
  - Or have a big party?
- Improvement: count per source lines of code
  - This allows for comparison
  - New definition: violations/KLOC

## Coding Standard Violations Improved

- Problem: violations are not equally important
- Introduction of severity levels
  - Starting from 1 (most severe) to n (layout)
  - Severity levels defined by experts
  - New definition: violations/KLOC/severity level

The screenshot shows the TCS Viewer application window. The title bar reads 'Quality Database Viewer (V6.3.3) - Windows Internet Explorer'. The address bar shows a URL. The main window displays a table titled 'Coding Standard Violations / KLOC per Level'. The table has columns for 'Name', '1', '2', '3', '4', '5', '6', '7', '8', and 'Total'. The rows list various coding standards and their corresponding violation counts per level and a total.

## Status Static Confidence Factor

- Used actively by most customers
- General confidence factor target is 80%
- Quarterly TIOBE QA Award:
  - Highest confidence factor
  - More than 500 KLOC
  - Less than 1 suppression/KLOC
- Q1 2009 won by Océ Varioprint 6250 team
  - Even feedback from Océ board of management

TIOBE SOFTWARE - The Coding Standards Company

## Success Factors Software Metrics

- Define what values are good/bad (set norms)
- Put the metric in practice *and let it evolve*
  - Make sure everybody is using the same metric
  - Collect as much as feedback as possible
- Make sure it is measured automatically
- Publish the results and benchmark

TIOBE SOFTWARE - The Coding Standards Company

## Two TIOBE Wake-up Calls

- Survey of Philips Healthcare MRI scanners:
  - Only 13% of field defects prevented
  - So the power of confidence factor is limited
- French customer company:
  - Based its incentives on confidence factor
  - It was the only thing they measured!

TIOBE SOFTWARE - The Coding Standards Company

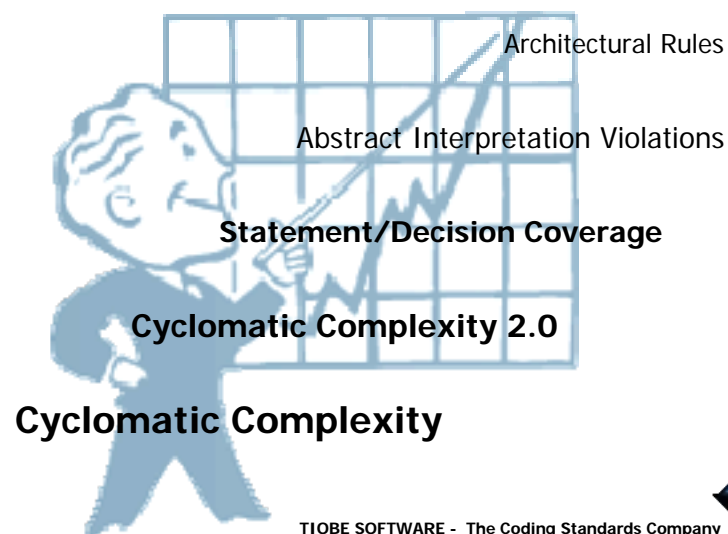

## What's next?

- Measure and monitor more metrics
  - Based on ISO 9126 (21 quality factors)
  - Only 4 quality factors immediately applicable
- Functionality: test coverage
- Reliability: abstract interpretation
- Changeability: cyclomatic complexity
- Maintainability: static confidence factor
